Lab 7 Questions

1. The advantages of using Selenium is that you are able to make sure changes to the interface do not affect the usability of the site. Furthermore you can automate the testing of the gui and not have to manually click through all the pages to ensure they are still working.
2. The downside is that you have to manually navigate the pages at least once and make sure that each and every path is tested. This becomes exponentially hard when the number of different webpages increases significantly.
3. `<tr><td>MyCase</td></tr>`
4. `<tr><td>click</td><td>[[@td='myLink']</td><td></td></tr>`
5. The test cases are readable without having to open them in Selenium and they are easily configurable without the use of a special tool. The downside is that HTML is not designed to hold testcases like this so it is weird to have test cases in html when it could be in its own format.
